

# STOCKTAKING REPORT

Bosnia and Herzegovina, Missing persons from the Armed Conflicts of the 1990s: A *Stocktaking* published by ICMP in December 2014 is the most comprehensive analysis yet written of a country's effort to account for missing persons after armed conflict.

Number of people estimated to have been killed in the conflicts that accompanied the break-up of Yugoslavia.

140,000 

Just over

100,000 

Number of people who lost their lives as a result of the 1992-95 conflict in Bosnia and Herzegovina.

Over

31,000

Estimated number of people who were unaccounted for when the fighting ended in Bosnia and Herzegovina.

23,500

Estimated number of these missing persons who had been accounted for as of June 2025.

7,500

Estimated number still missing

An estimated 75% accounted for

By 2000, around 8,000 of the missing had been identified using traditional methods (identity documents, articles of clothing, distinguishing features). Following extensive consultations, in 2001, ICMP launched an identification process based on the use of DNA. This process compares DNA profiles obtained voluntarily from relatives of the missing to post-mortem samples provided to ICMP through agreements with local authorities. The decision to harness this new technology resulted in an exponential rise in the number of identifications.

74,315

Number of reference samples collected

24,626

Number of missing persons whose relatives provided reference samples from which DNA could be typed

**Number of reference samples collected** This shows the total number of reference samples provided by family members to identify missing persons in Bosnia and Herzegovina. The number of reference samples needed for identification depends on how closely related the family members are to the missing person and on the DNA characteristics of the family. Sometimes a reference sample from a single parent or child is enough, but usually reference samples from two or more close relatives are needed. Samples from family members with closer kinship, such as parents, children and siblings of the missing person, are the most useful, but samples from more distant relatives may also be helpful.

54,480

Number of post-mortem samples provided by authorities in Bosnia and Herzegovina to ICMP

15,686

The number of DNA matches of unique individuals.

According to a survey of citizens in Bosnia and Herzegovina conducted by ICMP, the search for the missing is not perceived to be biased with regard to ethnicity or nationality and is viewed by an overwhelming majority as an indispensable element in post-war recovery.

# 80%

of BiH citizens believe that resolving the fate of the missing contributes to reconciliation

# 87%

of people believe that joint memorials and days of commemoration should be dedicated to all missing persons

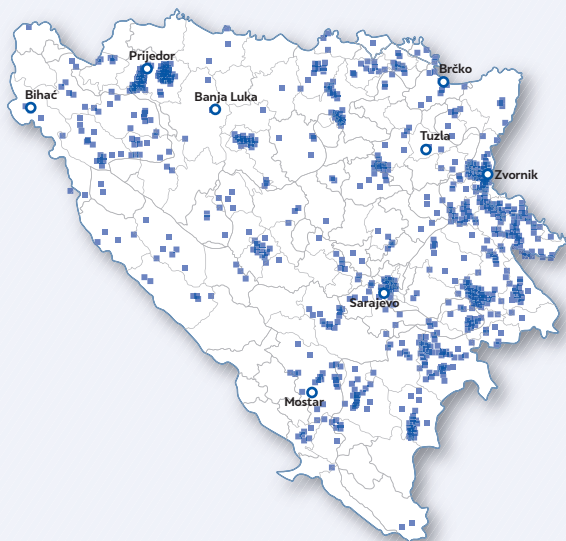

# 96%

of people believe the search for the missing should not be conducted on the basis of nationality or religion

Analysis of the Central Records of Missing Persons shows no significant difference in the identification rate of individuals reported by the Federation of Bosnia and Herzegovina (75 percent) and the Republika Srpska (76 percent). In other words, the average rate of identification is the same no matter where in Bosnia and Herzegovina a person was reported missing.

Map of fields from which human remains have been recovered since 1996

ICMP has supported hundreds of site investigations and the resolution of many thousands of cases. Assistance in developing the planning, management and undertaking of excavations, documentation of sites, collection of evidence and analysis of data is critical to the process of justice. The Archaeology and Anthropology Assistance Program supports the investigation of crime scenes and mass and other clandestine graves and provides assistance in the search for, recovery, documentation, examination and analysis of mortal remains.

The International Commission on Missing Persons has launched a new on-line application called the "Site Locator". The application allows for the reporting of mass graves and other sites where the mortal remains of missing and disappeared persons may be located. Information can be provided anonymously, or may include contact details.

	Reported missing	Identified
● Srebrenica 1995	7757	7022
● Lower Podrinje	4074	2652
● Posavina	1456	1030
● Krajina	6578	5194
● Upper Podrinje	3715	2197
● Ozren 1995	340	245
○ Northeast Bosnia	548	385
● Central Bosnia	2252	1603
● Sarajevo	2266	1705
○ Herzegovina	1675	1269
● Western Bosnia	629	531
● Unknown	63	57
